

### **\*Introduction\***

Hello everyone,

My name is Nese chaithra. This is my guided project from SmartInternz platform. The title of the project: Calculating Family Expenses Using ServiceNow.

### **\*Project Overview\***

The Calculating Family Expenses Using ServiceNow is a digital platform designed to streamline family expense management within the ServiceNow ecosystem. It efficiently tracks and manages household expenditures, providing real-time updates on expenses, budgets, and financial goals. The system enables family members to quickly log expenses, generate reports, and make informed financial decisions. It also offers features like budgeting and expense categorization, making it easier for families to manage their finances effectively. By automating manual processes, the system reduces errors and improves overall financial management.

### **\*Tools and Technologies\***

I used ServiceNow platform, along with its built-in features such as forms, workflows, and reporting tools. I might have also utilized ServiceNow's APIs and integrations to enhance the application's functionality.

### **\*Code Walkthrough\***

Now, I will show the configuration. First, I created custom forms to capture family expenses. Then, I configured workflows to automate expense tracking and approval processes. I also set up reporting tools to provide insights into household financial management. Additionally, I might have used ServiceNow's analytics capabilities to identify trends and predict future expenses.

### **\*Conclusion\***

This project helps families manage their expenses efficiently and make informed financial decisions within the ServiceNow platform. It can assist in identifying areas of cost savings and optimizing household budgets. Thank you SmartInternz and mentors for this opportunity. Thanks for watching!
